

Millions of shoppers benefit from new mobile infrastructure at Westfield London and Westfield Stratford City

3 years ago

Wireless Infrastructure Group (WIG), the UK's leading neutral host infrastructure provider to operational real estate unveils its latest project.

New, state-of-the-art neutral host networks have been fully launched at Westfield London and Westfield Stratford. The 5G enabled networks support all of the mobile operators (and all their technologies and frequencies) and extend to over 4.5 million square feet including over 600 retail, services and food and beverage outlets.

Westfield is committed to creating shopping destinations that provide unique platforms for retailers and brand events and offers exceptional and constantly renewed omnichannel experiences for shoppers.

UK operators have welcomed WIG's approach, which ensures customers at the Westfield centres can benefit from reliable network coverage and fast data connections during their visits.

Jacinta Rowsell, Director of Operations, URW UK added: "Today's shoppers expect high-quality, seamless mobile coverage to support every stage of their retail experience. Robust connectivity is also integral to our occupiers' operations, marketing and sales. WIG analysed our centres, understood our requirements and challenges, and has delivered solutions that enable world-class mobile services that not only support our existing needs, but also anticipate the dynamic and evolving requirements of our flagship tenants and their customers."]

Craig Birchenough, Indoor Networks COO at WIG, commented: "WIG's experienced team has guided this

project from design and construction through to engaging all of the mobile operators. WIG now delivers neutral host infrastructure to operational real estate with over 1.5 billion visitors a year including 75% of the UK's 20 largest shopping malls".
