

Legrand launches adaptable cable tray fittings for faster installations

2 years ago

[Legrand UK & Ireland](#) has expanded its Cablofil range with the launch of Cablobend, a flexible and configurable solution that improves the steel wire cable tray installation process.

Cablobend allows for quick changes in cable direction and minimises the need for cutting or additional materials. It offers ease of use, enabling installers to easily create bends, drops and configurations by hand.

Available in three heights and widths between 100mm and 600mm, Cablobend is compatible with Fasclic+ and standard Cablofil lengths, ensuring it can seamlessly integrate into existing installations.

Designed to meet the needs of diverse settings, such as data centres, renewable energy plants and food processing environments, Cablobend ensures quick, safe and flexible installations, without the need for specialised tools. The range also comes in four finishes, including 304 L stainless steel, 316 L stainless steel, electrozinc plated and pre-galvanised zinc aluminium coating.

The inclusion of Cablofil's T-shaped welded safety edge and rounded steel wires makes Cablobend even safer to use both during installation and when pulling cables into or out of position.

Cablobend's simple to use design reduces labour time, costs and material wastage, making it an ideal solution for contractors working on projects with tight deadlines or specific technical demands.

Mark Williams, Lead Marketing Manager – Cable Management at Legrand UK & Ireland, said: “Speed and safety are the twin lodestars of anyone in our industry, so we created Cablobend to help maximise both. It can be quickly adjusted by hand, saving time and cost, all the while making it possible for contractors to

provide safe and reliable cable management that is easily customised to best serve each individual project.”
