

KeyTracker launches mini e30 tracking system

11 months ago

[KeyTracker](#), the UK's leading designer and supplier of secure key and asset management systems, has launched the mini e30, a compact electronic key cabinet designed for facilities managers with small property portfolios, seeking enhanced compliance, greater accountability, and improved reporting.

The system automatically tracks who has which keys, when, and for how long, and sends overdue alerts with audit reports to management helping to reinforce user responsibility. The system is designed to offer quick access to keys and can be configured to set access permissions for different members of the team – for example, only allowing those who are access certain equipment or buildings to use the keys.

Developed in response to increasing demand for a mid-range, electronic key management system that can operate standalone or networked, the mini e30 offers plug and play versatility in a sleek, space-efficient design, with a 5" touchscreen. It includes the option of AWS cloud hosting, automated daily email reports, and supports various access options, including pin codes, fingerprints or card access. The cabinet is just five key positions wide, with a staggered layout supporting up to 30 key bunches.

Fully customisable to each business' unique needs, the mini e30 is delivered pre-configured and features easy programming technology for fast, hassle-free installation.

Andy Smith, Director of KeyTracker, said: "Developed to match an increasingly demanding world of smart accountability, improved efficiency and fast access to authorised users, this cabinet offers a practical and cost-effective solution for businesses with limited space or fewer keys to manage, all while retaining the advanced capabilities of our larger systems.

"With full audit trails, customisable access control, and a sleek design, whether you're a facilities manager

with a more compact portfolio of properties, the mini e30 is designed to meet your needs.”
