

Baxi Launches New Cascade Configurator for Quinta Ace Range to Simplify Gas Boiler System Specification

6 months ago

Heating and hot water solutions provider [Baxi](#) has introduced an innovative Cascade Configurator tool to help customers simplify equipment selection for the Quinta Ace range of commercial gas boilers.

This new digital tool provides consultants, contractors and specifiers with flexible and scalable boiler cascade configurations for the Quinta Ace range, with options for aluminium or stainless-steel plate heat exchangers, low-loss headers, or air dirt separators.

The tool delivers instant and downloadable specifications and quotes via email, allowing customers to tailor solutions to specific output or cascade requirements for projects of any size. This professional documentation comes ready to use in tenders, design submissions, or customer proposals as required.

After the customer has answered several quick questions about their project, the Cascade Configurator generates a personalised cascade solution with estimated costs. The customer's local Baxi Technical Sales Manager will be available to provide expert support and advice on your specification.

Speaking about the launch, Shane Suter, Commercial Business Director at Baxi, said: "We are delighted to be launching our Cascade Configurator Tool to support customers and merchants in determining the appropriate cascade solution for their Quinta Ace boilers.

"This new tool promises to greatly streamline the system design process and provide stakeholders with the freedom to tailor this to meet the unique demands of their projects."
