

## Universal Compatibility Meets Installer Simplicity in New Codelocks Latch Strike

3 hours ago

[Codelocks](#), the leading designer and manufacturer of access control products, has launched its [Universal Latch Strike](#), an adaptable new product that reduces the need for multiple strike types while making lock installation easier.

The Universal Latch Strike is engineered to work with a range of latches for gates and external doors, including surface latches, adjustable gate latch, and traditional mortice latches. This versatility means installers no longer have to carry multiple latch strikes for different projects: they can use one for many installations.

“This product was made with the installer in mind,” said [Colin Campbell](#), CEO of Codelocks International Ltd. “Offering universal compatibility and flexible installation, the Universal Latch Strike gives installers a smarter solution that removes the guesswork from on-site alignment. That also means less time on corrections and reworking, without compromising on the quality of an installation.”

Codelocks has created the Universal Latch Strike to make aligning the latch and strike easier. It has multiple screw locating positions for flexibility, and 2mm packing pieces for fine adjustments. These allow installers to adapt the product to each installation, further reducing the need for different latches and enabling first-time-right fitting.

The Universal Latch Strike also speeds up installation. It has a surface-mounted design that eliminates the need to cut recesses into the door or gate frame. And where installers require flexibility on site, it can be easily adapted for recessed installations.

Available in brushed steel and black marine-grade finishes, the Universal Latch Strike offers flexible colour-

matching options to suit a range of applications. It ships with wood screws for timber frames and machine screws for metal frames. It has raised locating dots on the inner face, ensuring a secure, stable fixing on timber. It can be installed on both outward and inward openings, along with flush and double gates.
